History

Buckingham County’s rich supply of slate was first discovered in the 1700s by Welsh settlers, who used slabs of the blue-black rock they found in the banks of Hunts Creek to roof their homes. Unbeknownst to them, these settlers had stumbled upon one of the finest veins of slate in the world. Founded in 1867, Buckingham® Slate is still produced at this same location in Arvonia, Virginia. The slate’s properties – unfading color, low absorption rate, a lifespan of 150 years or more, natural textures and luster – make it a superior building material, unmatched by any other building medium. No other blue-black slate is found in many of the country’s top universities, religious buildings and homes, delivering an architectural aesthetic that can’t be matched.

One of our country’s founding fathers, Thomas Jefferson, was among the first Americans to recognize the beauty and value of Buckingham County’s slate, which he specified in his architectural designs. Jefferson specified the use of Buckingham® Slate on the campus of the University of Virginia, where Buckingham® Slate can still be found on the centuries-old structures.

For more than 150 years, Buckingham® Slate has quarried the finest slate roofing, flooring and architectural products available anywhere. Our high-quality products are made using the finest slate available in Buckingham County, Virginia, a beautiful county in true unfading Buckingham® Slate.

A Letter to Architects from the U.S. Geological Survey

THERE IS A DIFFERENCE IN KINDS OF SLATE

Some slate producers, other than Buckingham® Slate, domestic and foreign, claim their slate qualifies as an unfading slate even though there is a slight to severe color change over the years. Any slate that changes in color cannot be classified honestly as an unfading slate, and these statements are misleading to the architects and specification writers. Buckingham® Slate is a Genuine Grade-A Unfading Slate, and we must guarantee in writing that Buckingham® Slate will not fade or disintegrate. According to the U.S.G.S. Bulletins #586, Page 147, “IN TEXTURE, DENSITY AND CAPACITY OF RESISTING ATMOSPHERIC AGENTS, IT CAN SCARCELY BE EXCELLED BY A SIMILAR MATERIAL IN ANY PART OF THE WORLD.”

THERE IS A DIFFERENCE IN KINDS OF SLATE, Buckingham® Slate is classified as a mica slate with continuous layers (Micaceous Matrix) with marked aggregate polarization. This quality of continuity in layers makes Buckingham® Slate practically non-absorbent with a rate of .01 to .08.

There are other slates on the market that have some mica content, but are without the continuity of mica layers and contain sufficient FeCO₃ (Ferrous Carbonate) which causes fading upon exposure to weather. There is clay slate and limestone slate on the market, and the architect should be selective in specifying slate. With the large content of clay and lime in some slates, the fading often starts from ten to fifteen years, whereby a light whitish cast will form on the face of the slate. This is due to the absorption of moisture which causes the lime and clay content to react causing the disintegration cycle.

We recommend the specification read, “slate shall be Genuine Grade A Unfading Blue-Black Slate” as produced by the Buckingham® Slate Company. (P.O.Box 8) 715 Arvon Rd., Arvonia, Virginia 23004-0008. Maximum absorption rate shall be .08.

*Larger and unique shaped boulders/slabs available upon request.*
Buckingham County’s rich supply of slate was first discovered in the 1700s by Welsh settlers, who used slabs of the blue-black rock they found in the banks of Hunts Creek to roof their homes. Unbeknownst to them, these settlers had stumbled upon one of the finest veins of slate in the world.

Founded in 1867, Buckingham® Slate is still produced at this same location in Arvonia, Virginia. The slate’s properties – unfading color, low absorption rate, a lifespan of 150 years or more, natural textures and luster – make it a coveted building material, unmatched by any other building material. To protect the found-in-many-of-the-country’s-locations, rooftop buildings and frost-resistant, aesthetically appealing, unfading slate quality, that has not changed.

One of our country’s founding fathers, Thomas Jefferson, was among the first Americans to recognize the beauty and value of Buckingham County’s slate, which he specified in his architectural designs. Jefferson specified the use of our slate on the campus of the University of Virginia, where Buckingham® Slate can still be found on the centuries-old structures. For more than 150 years, Buckingham® Slate has quarried the finest slate roofing, flooring and architectural products available anywhere. Our five-acre property in Buckingham County, Virginia, is the only reliable source of true unfading Buckingham® Slate.

A Letter to Architects from the U.S. Geological Survey

THERE IS A DIFFERENCE IN KINDS OF SLATE

Please refer to the Federal Specifications SS-S-451 which states that the classification of slate (in the U.S. Geological Survey Bulletin 918, Page 148) shall be taken as a guide for the Federal Specification. Slate is a Genuine Grade A Unfading Slate, and we will guarantee in writing that Buckingham® Slate will not fade or disintegrate. According to the U.S.G.S. Bulletin 586, Page 147, “IN TEXTURE, DENSITY AND CAPACITY OF RESISTING ATMOSPHERIC AGENTS, IT CAN SCARCELY BE EXCELLED BY A SIMILAR MATERIAL IN ANY PART OF THE WORLD.”

THERE IS A DIFFERENCE IN KINDS OF SLATE, Buckingham® Slate is classified as a mica slate with continuous layers (Micaceous Matrix) with marked aggregate polarization. This quality of continuity in layers makes Buckingham® Slate practically non-absorbent with a rate of .01 to .08. There are other slates on the market that have some mica content, but are without the continuity of mica layers and contain sufficient FeCO₃ (Ferrous Carbonate) which causes fading upon exposure to weather. There is clay slate and limestone slate on the market, and the architect should be selective in specifying slate. With the large content of clay and lime in some slates, the fading often starts from ten to fifteen years, whereby, a light whitish cast will form on the face of the slate. This is due to the absorption of moisture which causes the lime and clay content to react causing the disintegration cycle.

We recommend the specification read, “slate shall be Genuine Grade A Unfading Blue-Black Slate” as produced by the Buckingham® Slate Company, (P.O. Box 8) 715 Arvon Rd., Arvonia, Virginia 23004-0008. Maximum absorption rate shall be .08.

For more than 150 years, Buckingham® Slate has spearheaded the finest slate rooftops, flooring and architectural products available anywhere. Our five-acre property in Buckingham County, Virginia, is the only reliable source of true unfading Buckingham® Slate.
